Abstract

We construct representations afforded by finite cells in affine type G_2 for all choices of parameters.

Introduction

Let W be an affine Weyl group of type \tilde{G}_2 with diagram and weight function defined by

In this note we construct all the possible finite dimensional representation afforded by cells in type G_2 .

1 Finite dimensional representation

We introduce the following notation:

We set $u := q^b$, $v = q^a$ and for all $i, j \in \mathbb{Z}$, we set $\mu_{i,j} := u^{-i}v^j + u^i v^{-j}$

In the following array, we describe all the finite dimensional representation that appear in the generic cases.
