"Abel wrote in 1828: 'Divergent series are the invention of the devil, and it is shameful to base on them any demonstration whatsoever."

• From Littlewood's preface to GH Hardy's *Divergent Series* 

"Abel wrote in 1828: 'Divergent series are the invention of the devil, and it is shameful to base on them any demonstration whatsoever."

"Then came a time when it was found that something after all could be done about them. This is now a matter of course, but in the early years of the century the subject, while in no way mystical or unrigorous, was regarded as sensational, and about the present title, now colourless, there hung an aroma of paradox and audacity."

#### Series

$$\forall x \in \gamma$$

#### Asymptotic Series

• f is said to be asymptotic to a series  $\sum_{n=0}^{\infty}a_n(x-x_0)^n$  iff  $\forall N\in\mathbb{N}$ 

$$\lim_{x \to x_0} \frac{f(x) - \sum_{n=0}^{N} a_n (x - x_0)^n}{(x - x_0)^N} = 0$$

and we write

$$f(x) \sim \sum_{n=0}^{\infty} a_n (x - x_0)^n$$
, as  $x \to x_0$ 

#### Asymptotic Series

• f is said to be asymptotic to a series  $\sum_{n=0}^{\infty}a_n(x-x_0)^n$  iff  $\forall N\in\mathbb{N}$ 

$$\lim_{x \to x_0} \frac{f(x) - \sum_{n=0}^{N} a_n (x - x_0)^n}{(x - x_0)^N} = 0$$

and we write

$$f(x) \sim \sum_{n=0}^{\infty} a_n (x - x_0)^n$$
, as  $x \to x_0$ 

• The series is not required to converge.

#### An example

$$u'' - u' \left(1 - \frac{1}{x}\right) = 0$$

One solution is

$$Ei(x) = \int_{-\infty}^{x} \frac{e^{t}}{t} dt$$

$$\sim \frac{e^{x}}{x} \sum_{n=0}^{\infty} \frac{n!}{x^{n}}, \quad x \to +\infty$$

Other solutions differ from this one by a constant.

$$Ei(x) + C$$

#### An example

$$u'' - u' \left(1 - \frac{1}{x}\right) = 0$$

One solution is

$$Ei(x) = \int_{-\infty}^{x} \frac{e^{t}}{t} dt$$

$$\sim \frac{e^{x}}{x} \sum_{n=0}^{\infty} \frac{n!}{x^{n}}, \quad x \to +\infty$$

Other solutions differ from this one by a constant.

$$Ei(x) + C$$

$$F(x) \sim \sum_{n=0}^{\infty} \frac{n!}{x^n} \text{ as } x \to \infty \quad \Leftrightarrow \forall N \quad \left| \frac{F(x) - \sum_{k=0}^{N} k! / x^k}{N! / x^N} \right| \to 0$$

$$F(x) \sim \sum_{n=0}^{\infty} \frac{n!}{x^n} \text{ as } x \to \infty \quad \Leftrightarrow \forall N \left| \frac{F(x) - \sum_{k=0}^{N} \frac{k!}{x^k}}{N!/x^N} \right| \to 0$$
$$\sum_{n=0}^{10} \frac{n!}{100^n} = 1.0102062527748311680\dots$$

$$F(x) \sim \sum_{n=0}^{\infty} \frac{n!}{x^n} \text{ as } x \to \infty \quad \Leftrightarrow \forall N \left| \frac{F(x) - \sum_{k=0}^{N} k! / x^k}{N! / x^N} \right| \to 0$$

$$\sum_{n=0}^{10} \frac{n!}{100^n} = 1.0102062527748311680\dots$$

$$\sum_{n=0}^{100} \frac{n!}{100^n} = 1.0102062527748357112\dots$$

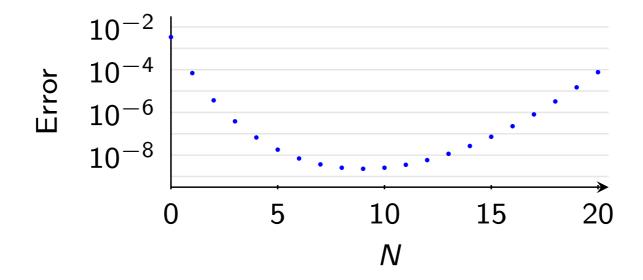

$$F(x) \sim \sum_{n=0}^{\infty} \frac{n!}{x^n} \text{ as } x \to \infty \quad \Leftrightarrow \forall N \left| \frac{F(x) - \sum_{k=0}^{N} k! / x^k}{N! / x^N} \right| \to 0$$

$$\sum_{n=0}^{10} \frac{n!}{100^n} = 1.0102062527748311680\dots$$

$$\sum_{n=0}^{281} \frac{n!}{100^n} = 732496.06921461904157\dots$$

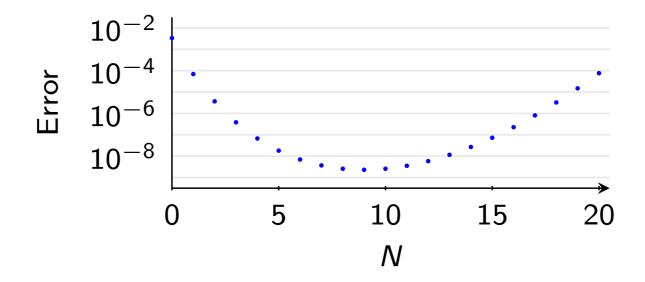

#### Truncation at least term

Truncate at the least term

$$F(x) = \sum_{n=0}^{N-1} \frac{n!}{x^n} + R_N$$

#### Truncation at least term

Truncate at the least term

$$F(x) = \sum_{n=0}^{N-1} \frac{n!}{x^n} + R_N$$

Exponentially small

N depends on x

### The identification problem

How do we distinguish

$$F(x) \sim \sum_{n=0}^{\infty} \frac{n!}{x^n}$$

$$\widetilde{F}(x) \sim \sum_{n=0}^{\infty} \frac{n!}{x^n} + \frac{e^{-x}C}{x}$$

in the limit  $x \to +\infty$ ?

• E.g., if C=1

$$\frac{e^{-100}}{100} = 3.7200759760208359630 \times 10^{-46}$$

### The identification problem

How do we distinguish

 $F(x) \sim \sum_{n=0}^{\infty} \frac{n!}{x^n}$  beyond all orders  $\widetilde{F}(x) \sim \sum_{n=0}^{\infty} \frac{n!}{x^n} + \underbrace{e^{-x}C}_{x}$ 

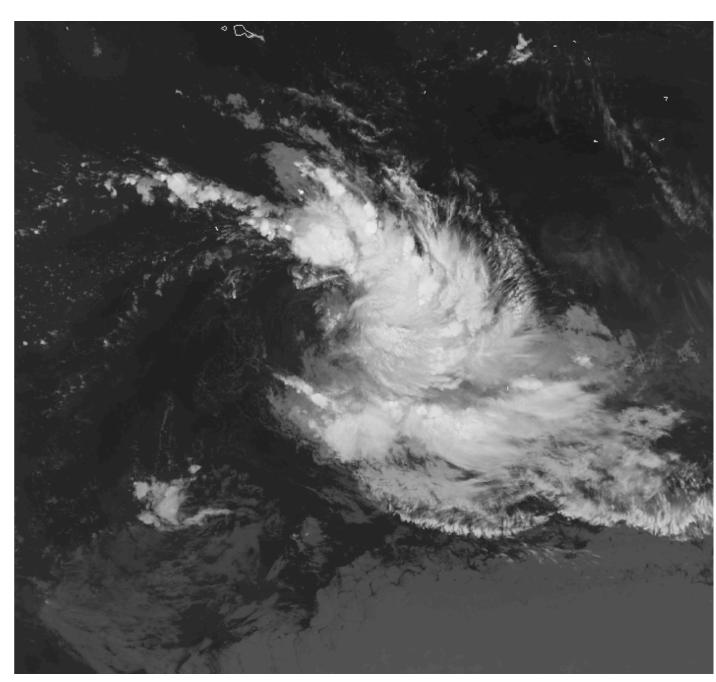

in the limit  $x \to +\infty$ ?

• E.g., if C=1  $\frac{e^{-100}}{100} = 3.7200759760208359630 \times 10^{-46}$ 

Why should we care?

#### Chaos

- "Does the flap of a butterfly's wings in Brazil set off a tornado in Texas?"
- To forecast future behaviour, we need to known initial states with infinite precision.
- This has become synonymous with *chaos*, but is also present in ordered, non-chaotic systems.

TC Gavin 1997 SW Pacific

#### Order

 The Painlevé equations, which arise as reductions of soliton equations

$$w_{\tau} + 6 w w_{\xi} + w_{\xi\xi\xi} = 0$$

$$\begin{cases} w = -2y(x) - 2\tau \\ x = \xi + 6\tau^2 \end{cases}$$

$$\Rightarrow \begin{cases} w_{\tau} = -24\tau y_x - 2 \\ w_{\xi} = -2y_x \\ w_{\xi\xi\xi} = -2y_{xxx} \end{cases}$$

#### Order

 The Painlevé equations, which arise as reductions of soliton equations

$$w_{\tau} + 6 w w_{\xi} + w_{\xi\xi\xi} = 0$$

$$\begin{cases} w = -2 y(x) - 2 \tau \\ x = \xi + 6 \tau^2 \end{cases}$$

$$\Rightarrow \begin{cases} w_{\tau} = -24 \tau y_x - 2 \\ w_{\xi} = -2 y_x \\ w_{\xi\xi\xi} = -2 y_{xxx} \end{cases}$$

$$y'' = 6 y^2 - x$$

#### Applications

- Electrical structures of interfaces in steady electrolysis L. Bass, Trans Faraday Soc 60 (1964)1656–1663

What do we know about the solutions of these equations?

### General Solutions

- Movable poles
- Transcendentality of general solutions
- Special solutions
- Asymptotic behaviours

 $P_{J}$ 

### Tronquée Solutions

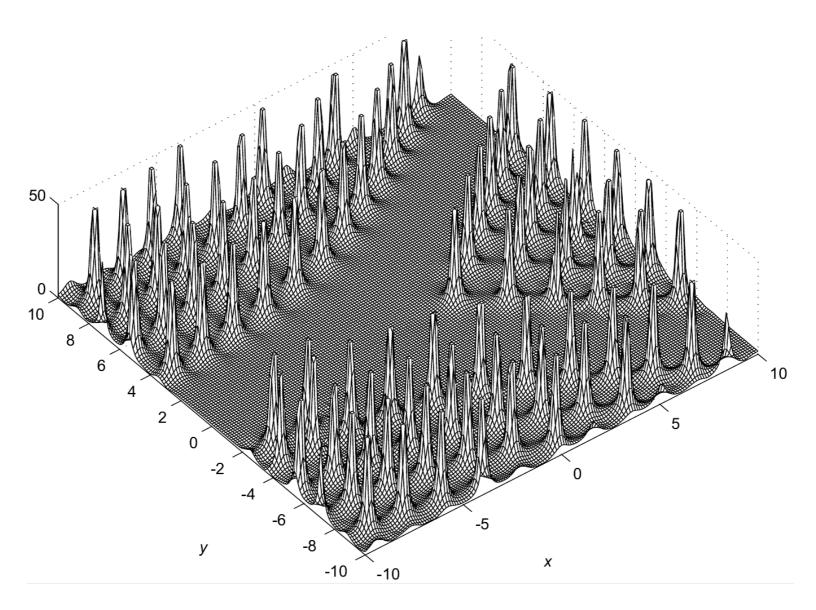

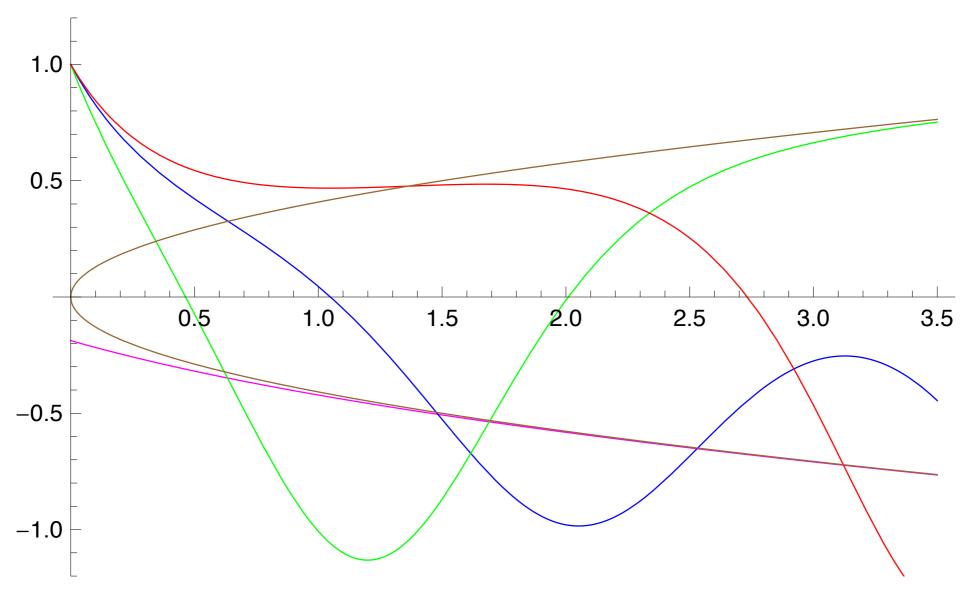

Fig. 3.1. Magnitude of the solution u(z) to the  $P_I$  equation in case of ICs u(0) = -0.1875, u'(0) = 0.3049, displayed over the domain z = x + iy,  $-10 \le x \le 10$ ,  $-10 \le y \le 10$ .

#### Real Solutions

Consider  $P_{\mathsf{L}} \quad w_{tt} = 6w^2 - t \text{ for } w(t), t \in \mathbb{R}$ 

#### The Real Tritronquée

 Theorem: ∃ unique solution Y(x) of PI which has asymptotic expansion

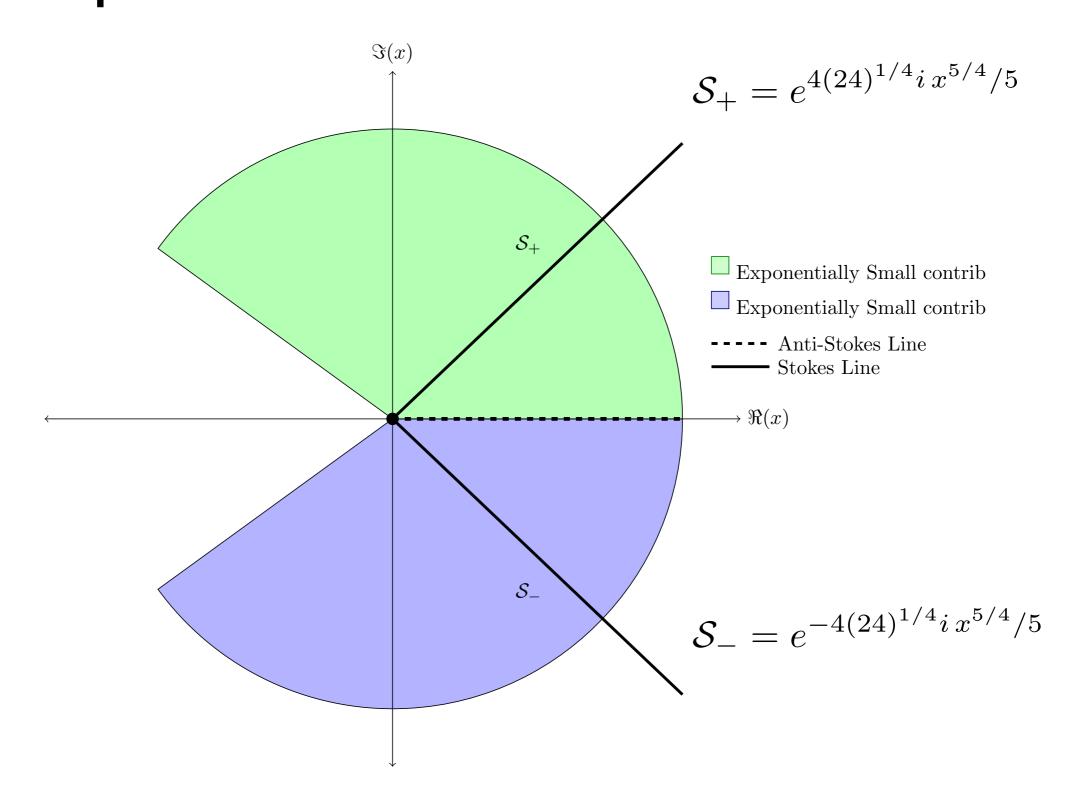

$$y_f = -\sqrt{\frac{x}{6}} \sum_{k=0}^{\infty} \frac{a_k}{(x^{1/2})^{5k}}, \text{ in } |\arg(x)| \le 4\pi/5$$

and

- $\bullet$  Y(x) is real for real x
- $\bullet$  Its interval of existence / contains  $\mathbb R$
- Y(x) lies below  $\Pi_{-}$
- It is monotonically decaying in I.

From Joshi & Kitaev Studies in Appl Math (2001)

# Exponential Terms

What about global dynamics?

#### Perturbed Form

In Boutroux's coordinates:

$$w_1 = t^{1/2} u_1(z), \ w_2 = t^{3/4} u_2(z), \ z = \frac{4}{5} t^{5/4}$$
$$\begin{pmatrix} \dot{u}_1 \\ \dot{u}_2 \end{pmatrix} = \begin{pmatrix} u_2 \\ 6u_1^2 - 1 \end{pmatrix} - \frac{1}{5z} \begin{pmatrix} 2u_1 \\ 3u_2 \end{pmatrix}$$

ullet a perturbation of an elliptic curve as  $|z| 
ightarrow \infty$ 

$$E = \frac{u_2^2}{2} - 2u_1^3 + u_1 \implies \frac{dE}{dz} = \frac{1}{5z} (6E + 4u_1)$$

#### Perturbed Form

In Boutroux's coordinates:

$$w_1 = t^{1/2} u_1(z), \ w_2 = t^{3/4} u_2(z), \ z = \frac{4}{5} t^{5/4}$$
$$\begin{pmatrix} \dot{u}_1 \\ \dot{u}_2 \end{pmatrix} = \begin{pmatrix} u_2 \\ 6u_1^2 - 1 \end{pmatrix} + \frac{1}{5z} \begin{pmatrix} 2u_1 \\ 3u_2 \end{pmatrix}$$

ullet a perturbation of an elliptic curve as  $|z| 
ightarrow \infty$ 

$$E = \frac{u_2^2}{2} - 2u_1^3 + u_1 \implies \frac{dE}{dz} = \frac{1}{5z} (6E + 4u_1)$$

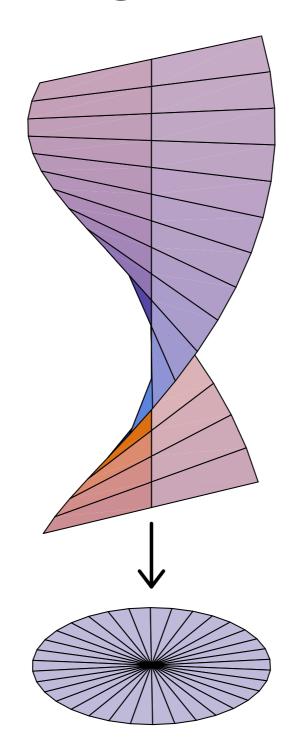

## Projective Space

- What if x, y become unbounded?
- Use projective geometry:  $x=\frac{u}{w}, y=\frac{v}{w}$   $[x,y,1]=[u,v,w] \in \mathbb{CP}^2$
- ullet The level curves of  $P_I$  are now

$$F_{\rm I} = wv^2 - 4u^3 + g_2uw^2 + g_3w^3$$

- all intersecting at the base point [0, 1, 0].
- ⇒ To describe solutions, resolve the flow through this point

## Resolving a base pt

#### Resolution

"Blow up" the singularity or base point:

$$f(x,y) = y^{2} - x^{3}$$

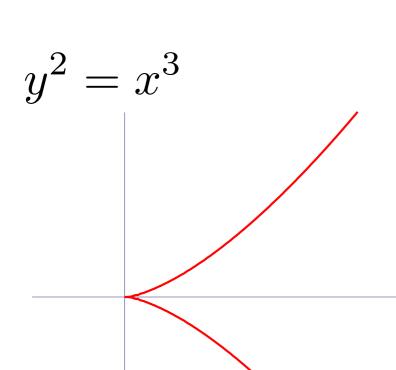

$$(x,y) = (x_{1}, x_{1} y_{1})$$

$$\Rightarrow x_{1}^{2} y_{1}^{2} - x_{1}^{3} = 0$$

$$\Rightarrow x_{1}^{2} (y_{1}^{2} - x_{1}) = 0$$

Note that

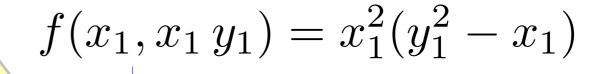

$$x_1 = x, y_1 = y/x$$

#### Method

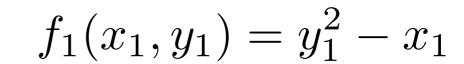

$$f(x,y) = y^2 - x^3$$

$$(x,y) = (x_1, x_1 y_1)$$

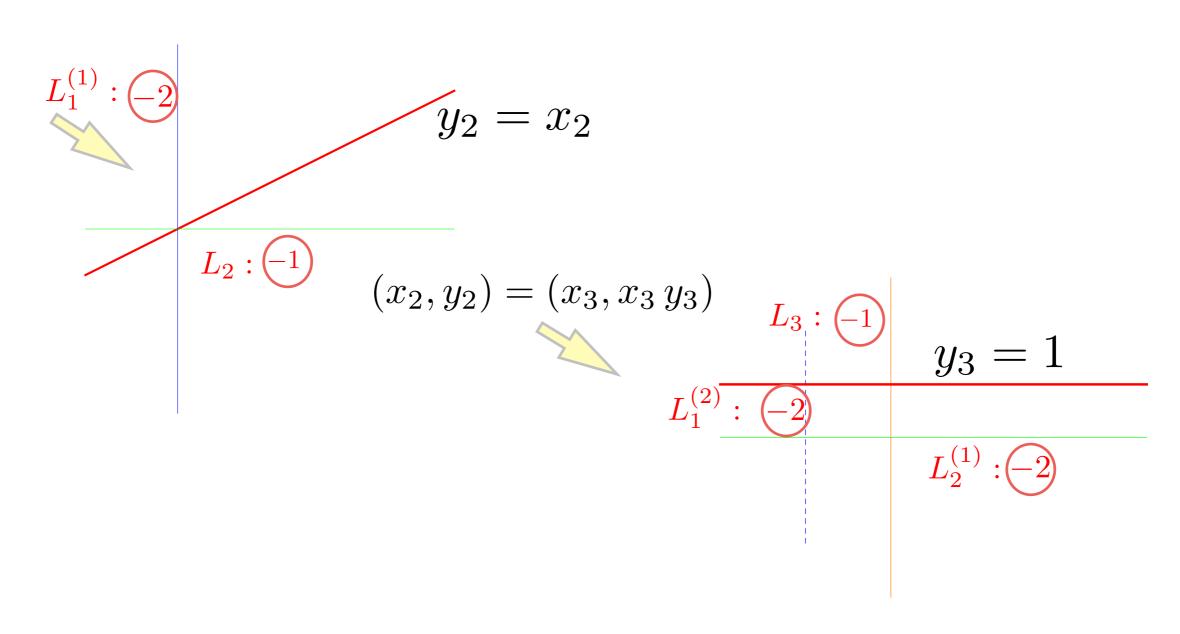

$$L_1: (-1)$$

$$L_1: -1$$
  $y_1^2 = x_1$ 

$$f_1(x_2 y_2, y_2) = y_2(y_2 - x_2)$$
  
 $(x_1, y_1) = (x_2 y_2, y_2)$ 

$$f_2(x_2, y_2) = y_2 - x_2$$

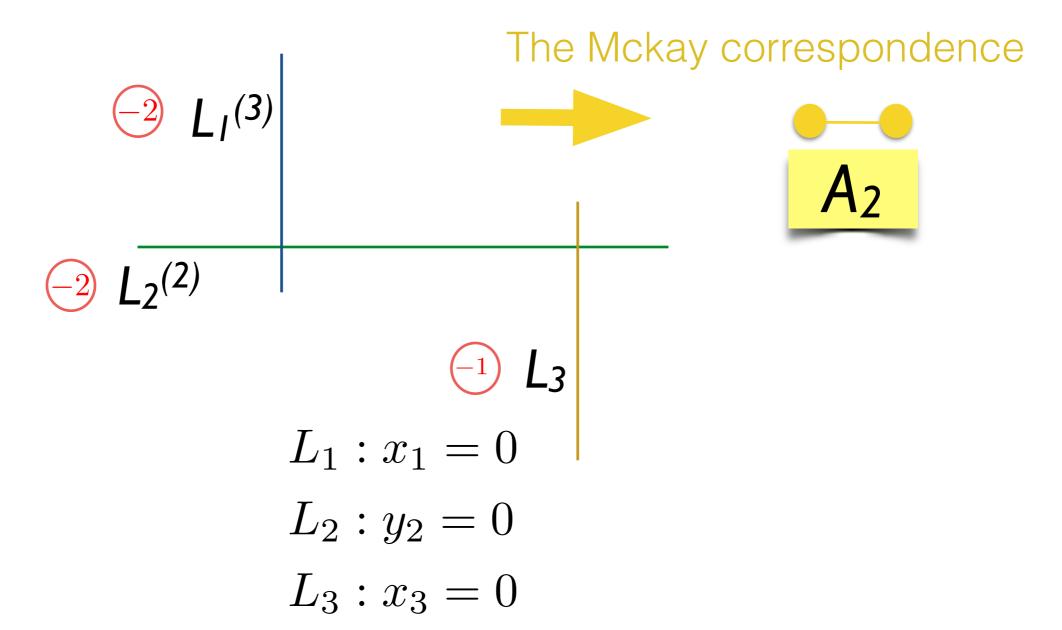

$$f_2(x_3, x_3 y_3) = x_3(y_3 - 1)$$

#### Initial-Value Space

$$\begin{bmatrix} -2 & L_{1}(3) \\ L_{2}(2) \end{bmatrix}$$
 $\begin{bmatrix} -1 & L_{3} \\ L_{1} : x_{1} = 0 \\ L_{2} : y_{2} = 0 \\ L_{3} : x_{3} = 0 \end{bmatrix}$ 

Now the space is compactified and regularised.

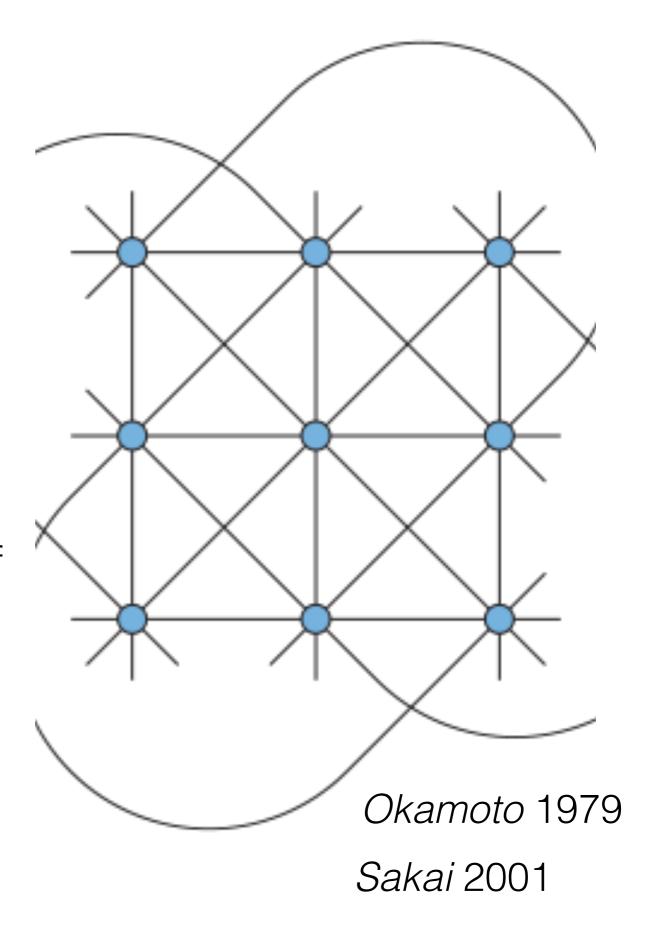

#### Initial-Value Space

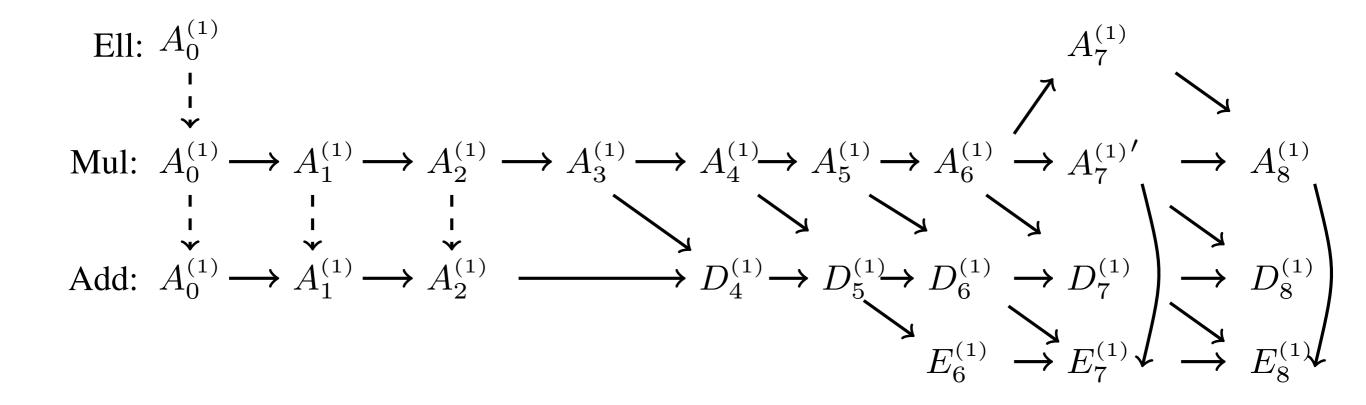

Now the space is compactified and regularised.

# Unifying Property

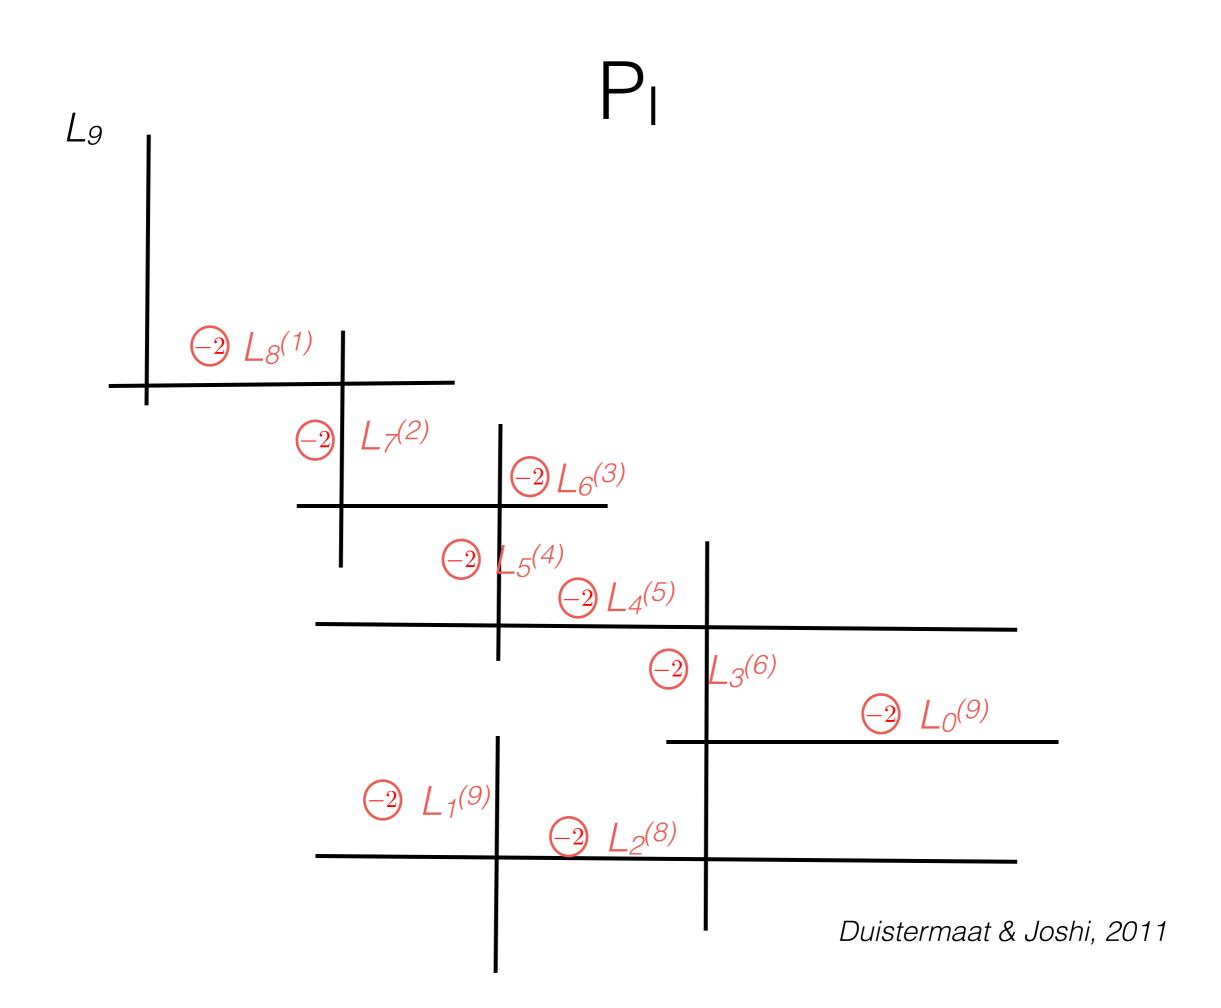

The space of initial values of a Painlevé system is resolved by "blowing up" 9 points in CP<sup>2</sup> (or 8 points in P<sup>1</sup>xP<sup>1</sup>)

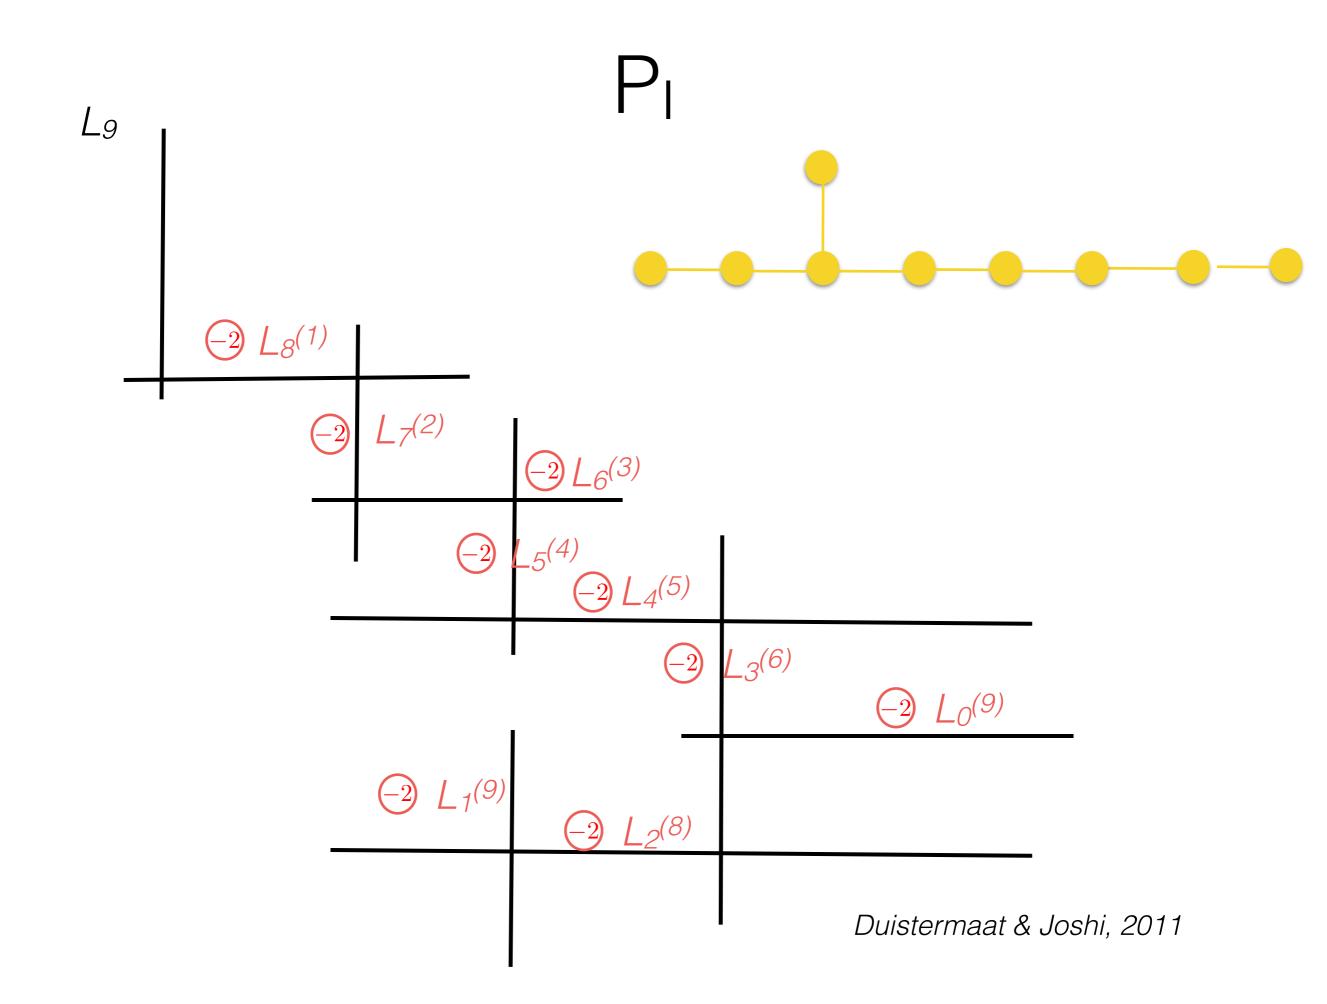

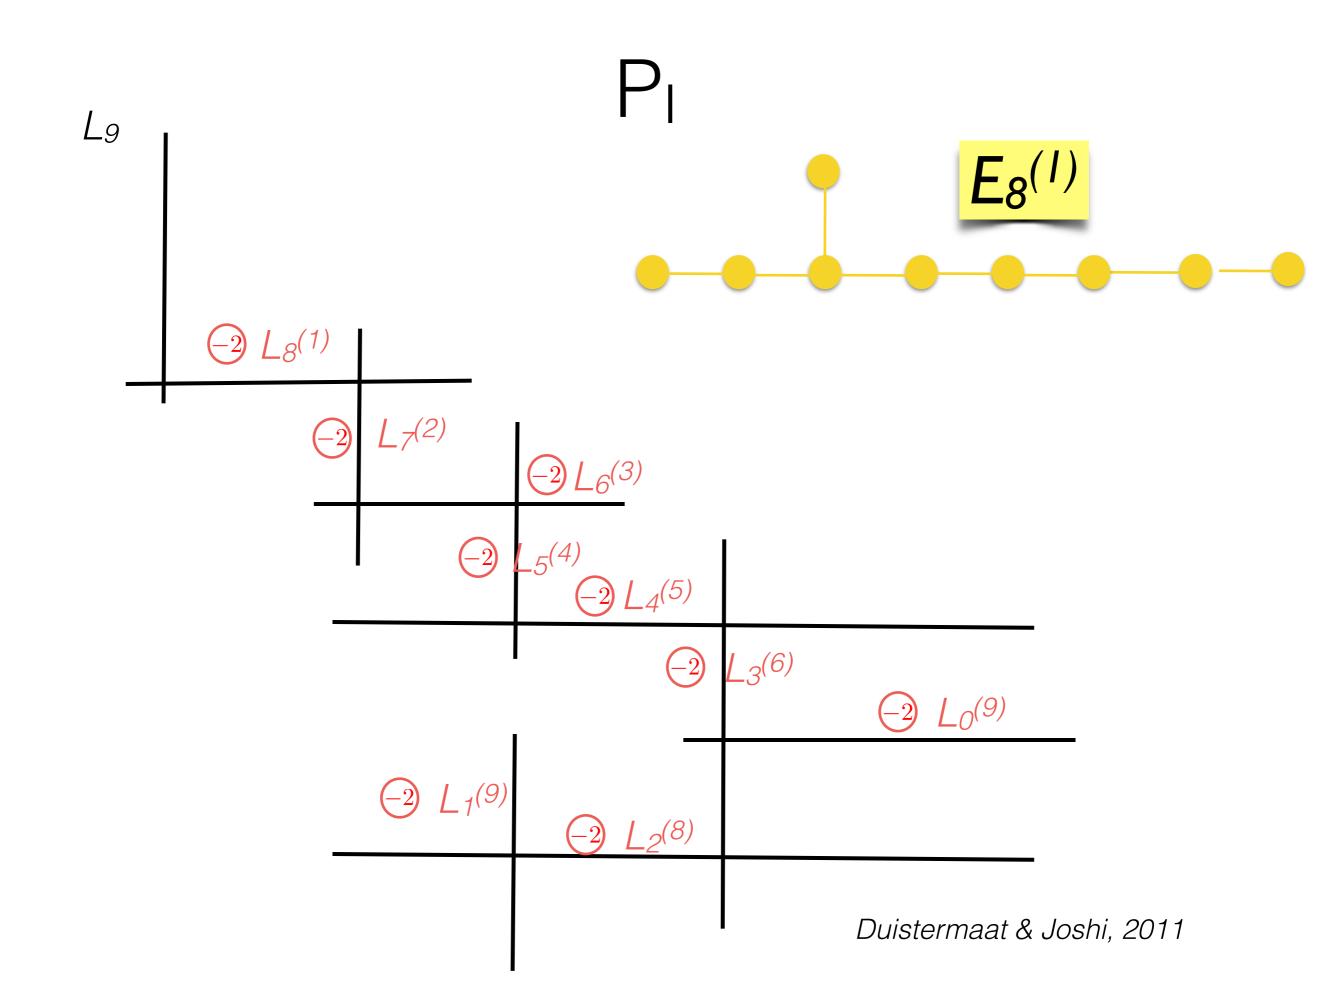

# Sakai's Description I

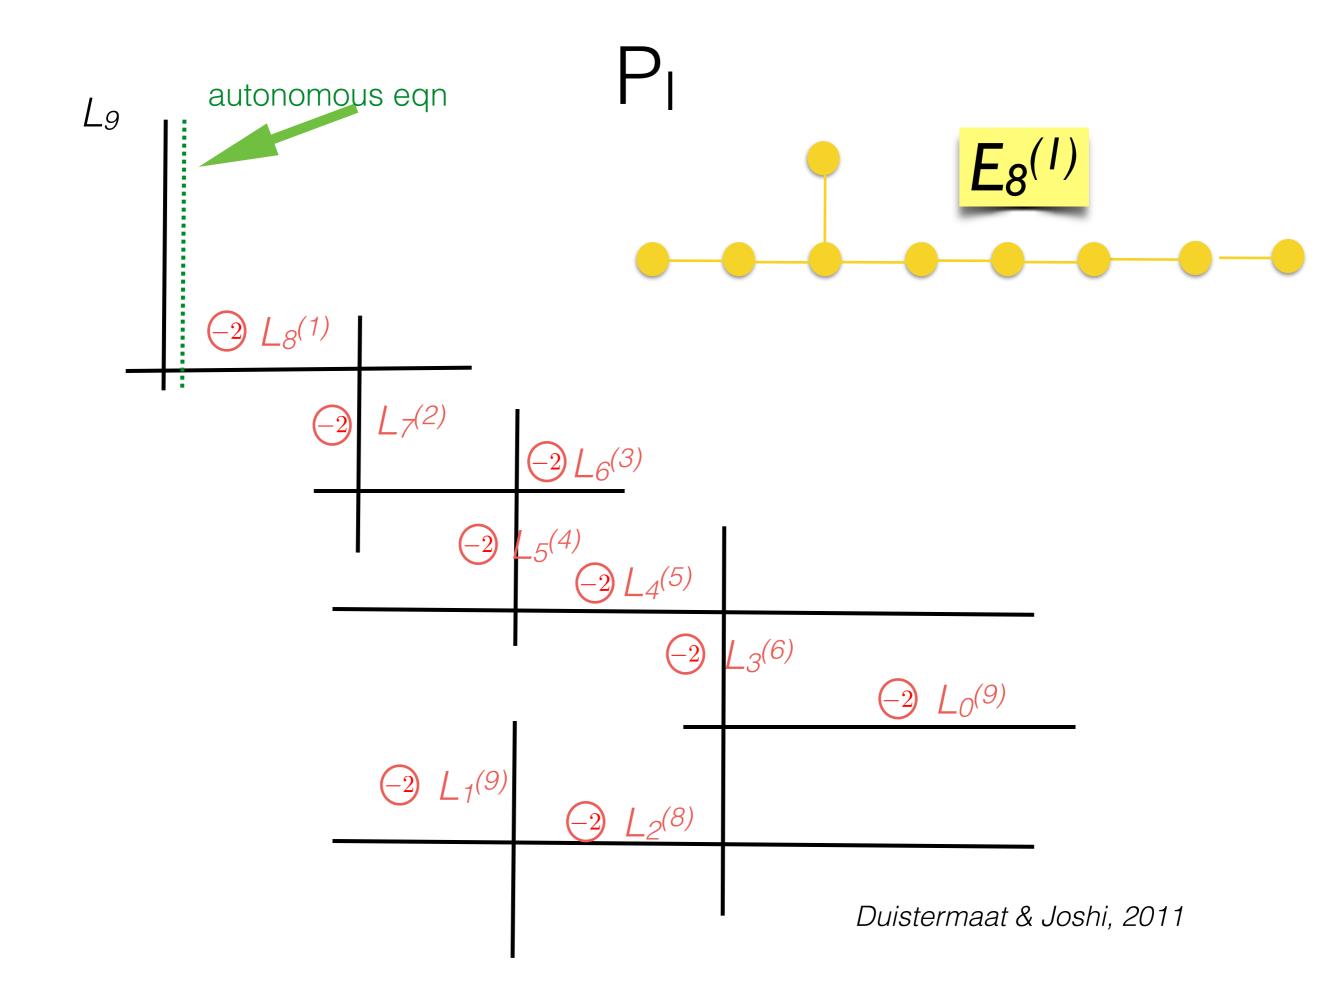

Initial-value spaces of all continuous and discrete Painlevé equations

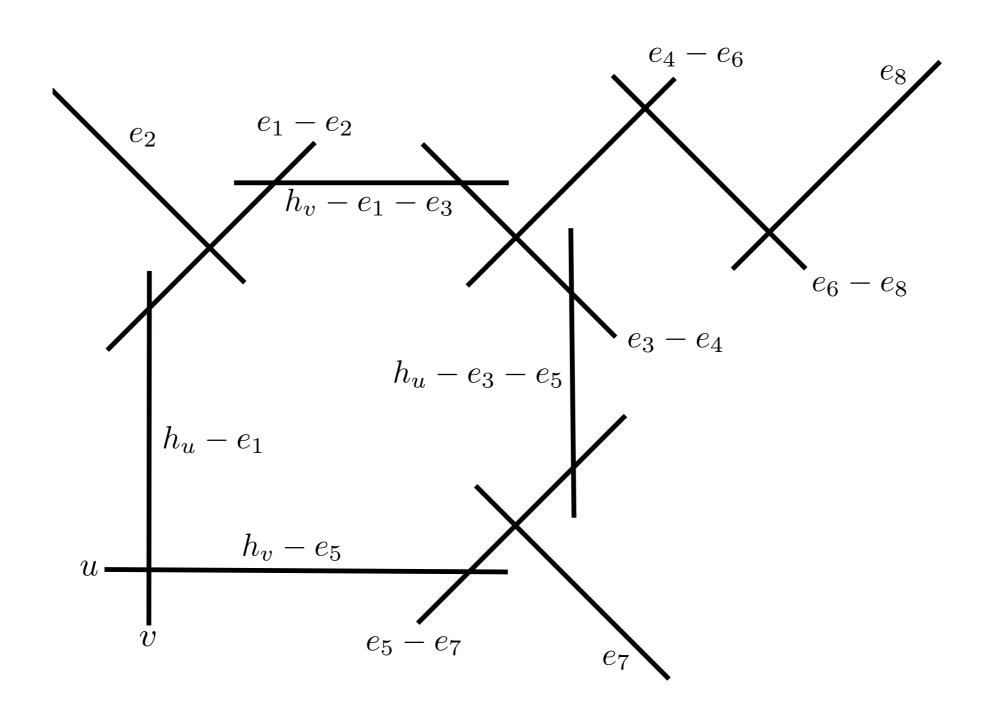

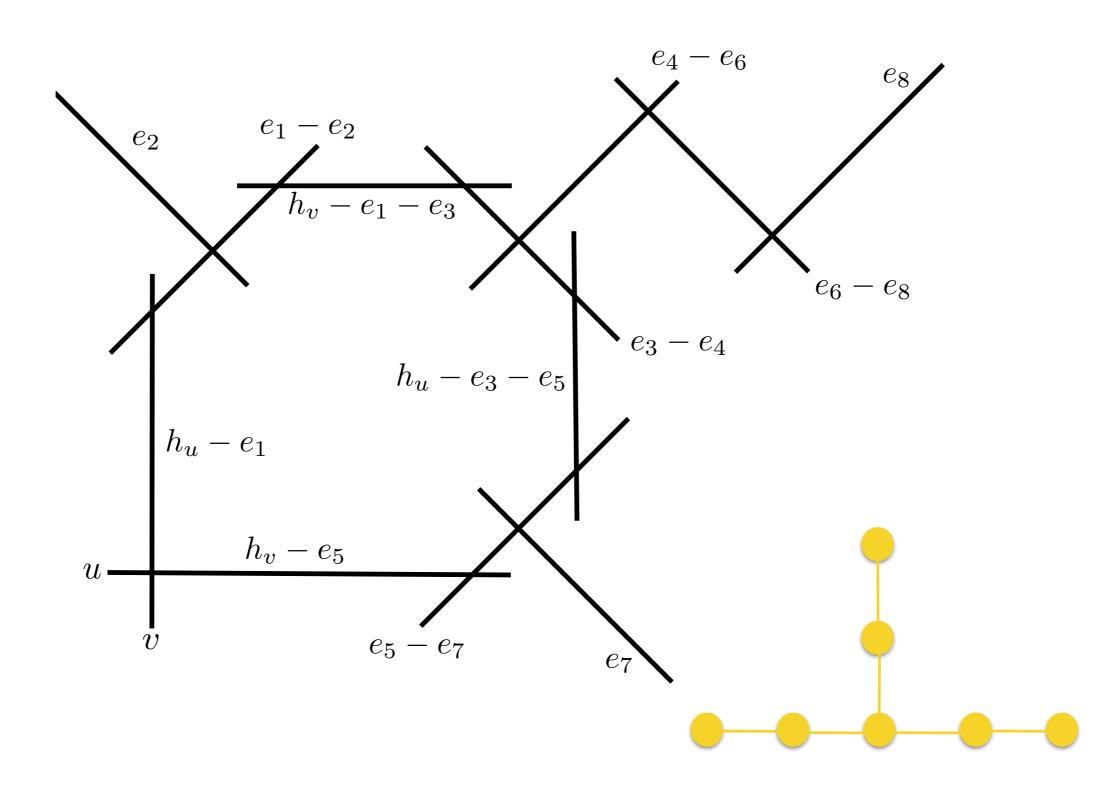

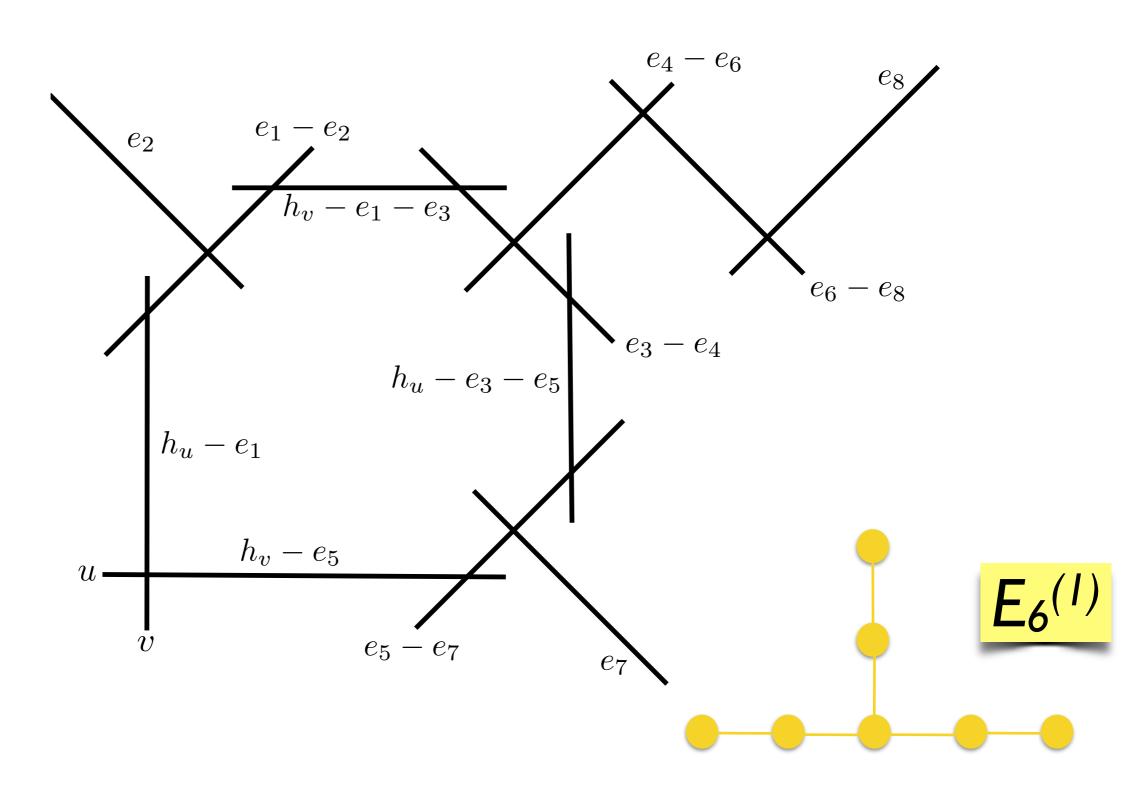

#### dPi

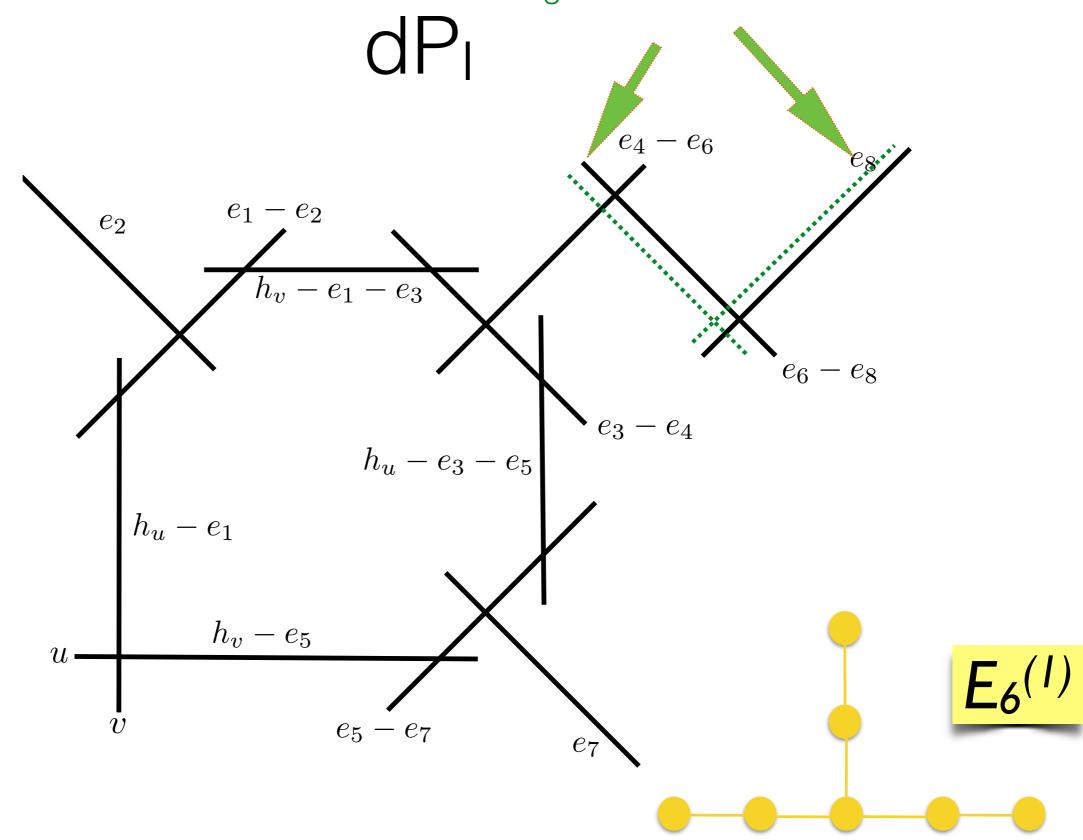

#### dPi

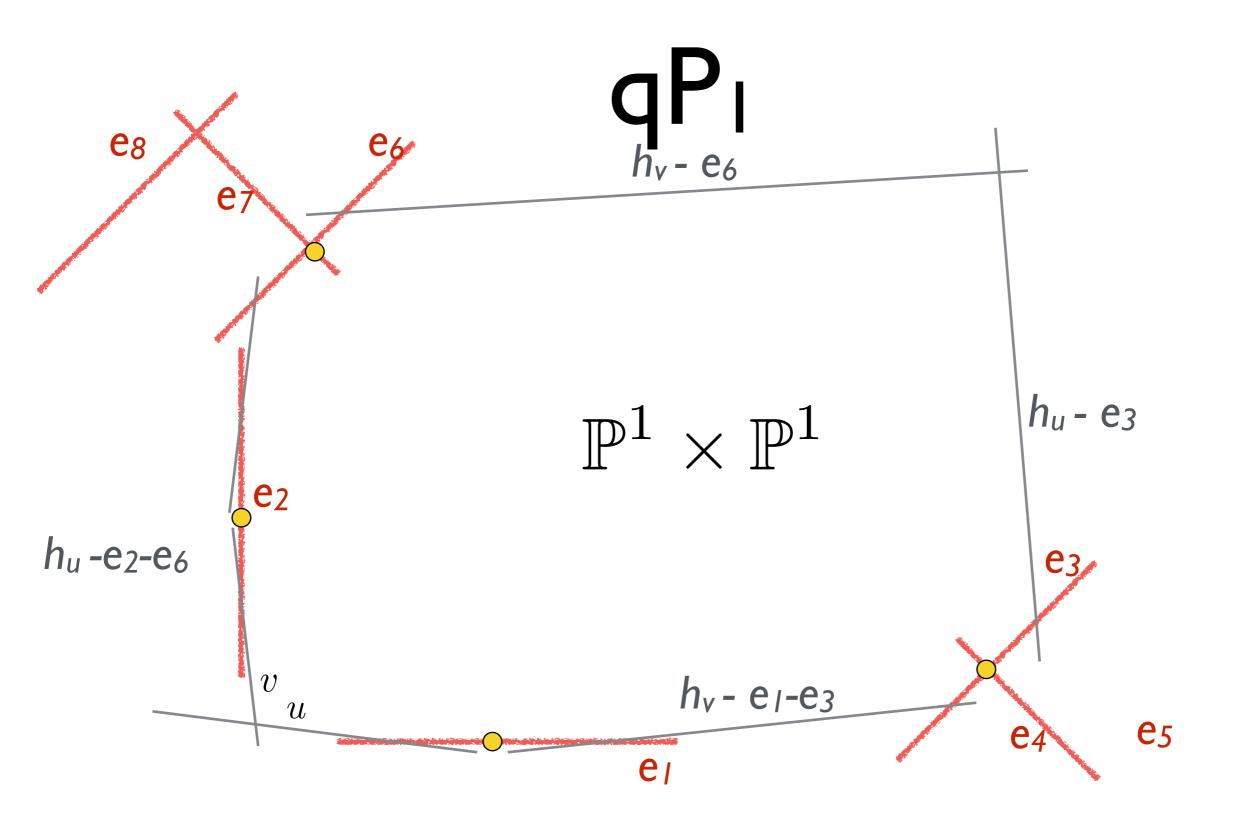

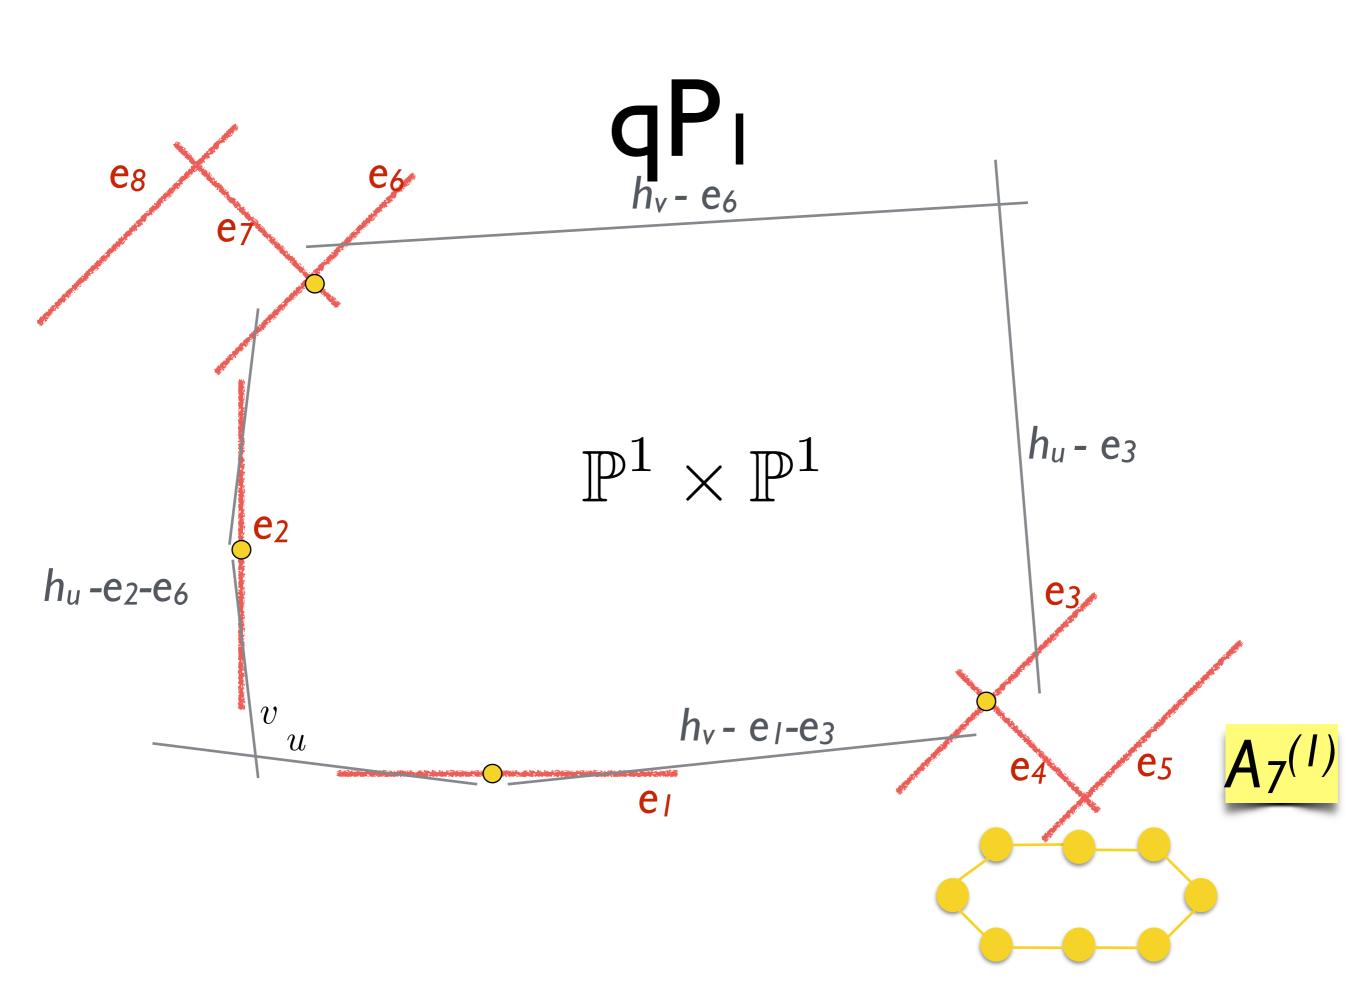

#### dPi

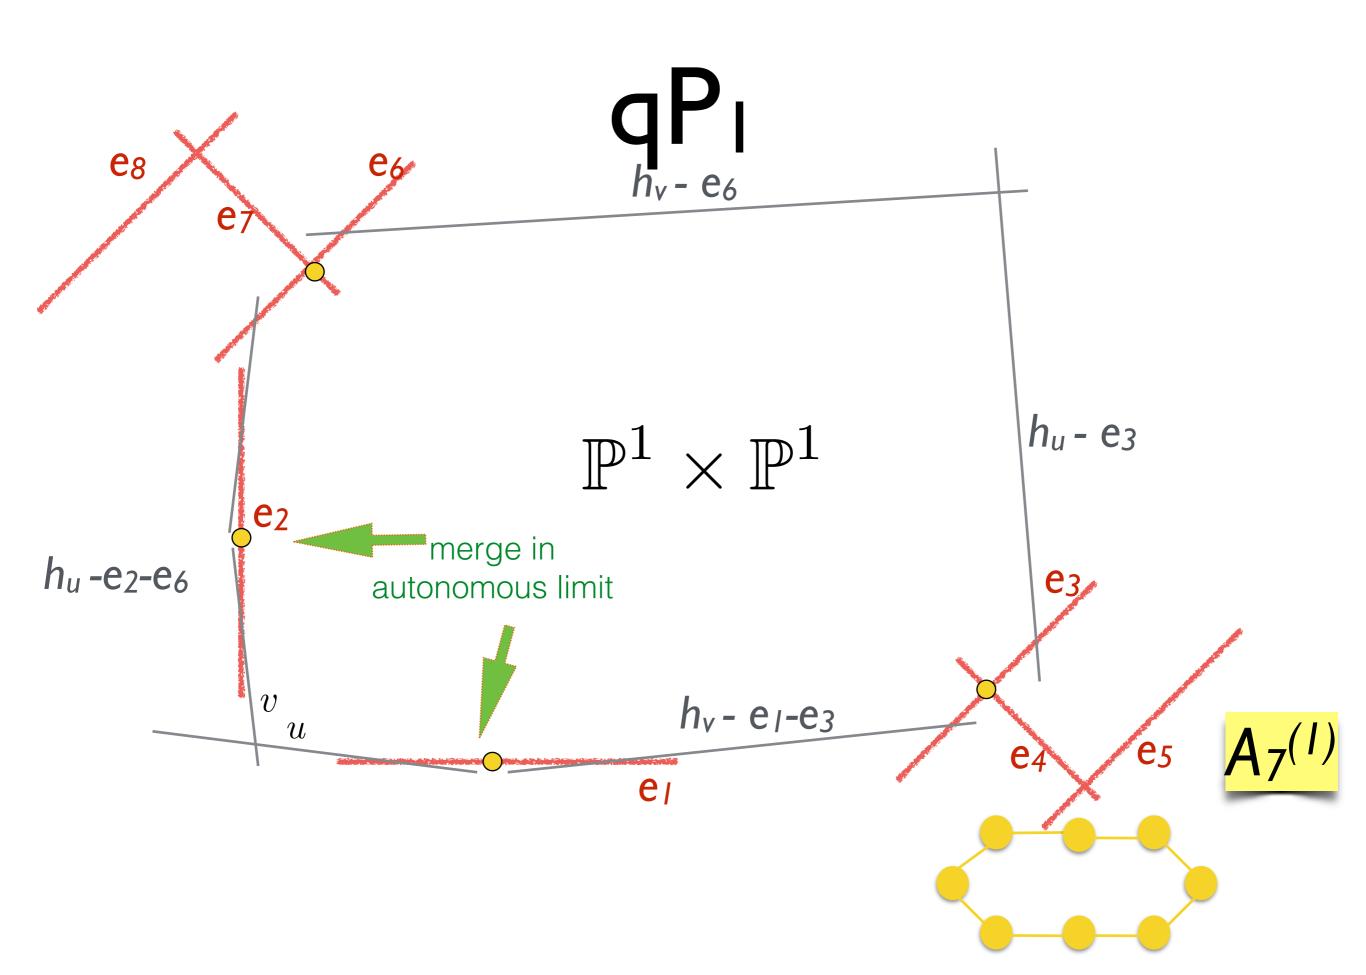

#### degenerate autonomous limit

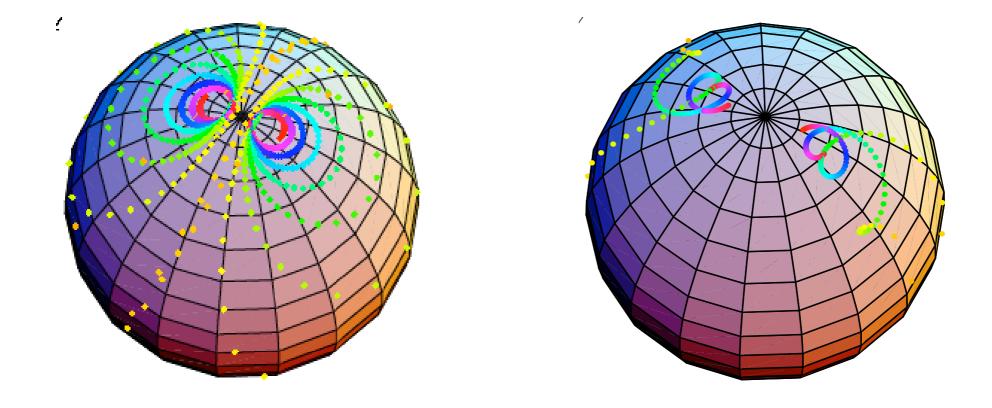

# Symmetric dP1

$$w_{n+1} + w_n + w_{n-1} = \frac{\alpha n + \beta}{w_n} + \gamma$$

- Consider  $n \to \infty$
- General behaviours are close to elliptic functions
- Special solutions are given by power series

Joshi 1997 Vereschagin 1995

#### Solutions

Solution orbits of scalar dP1 on the Riemann sphere (where the north pole is infinity).

## Scaling

$$\begin{cases} w_{2k} &= \frac{u(s)}{\epsilon^{1/2}} \\ w_{2k-1} &= \frac{v(s)}{\epsilon^{1/2}} \end{cases} \qquad s = \epsilon n$$

dPI becomes

$$(v(s+\epsilon) + u(s) + v(s-\epsilon))u(s) = \alpha s + \epsilon \beta + \epsilon^{1/2} \gamma u(s)$$
$$(u(s+\epsilon) + v(s) + u(s-\epsilon))v(s) = \alpha s + \epsilon \beta + \epsilon^{1/2} \gamma u(s)$$

• Series expansions as  $\epsilon \to 0$ 

$$u(s) \sim \sum_{m=0}^{\infty} \epsilon^{m/2} u_m(s)$$
$$v(s) \sim \sum_{m=0}^{\infty} \epsilon^{m/2} v_m(s)$$

# Types of solutions

Type A

$$u \sim \pm \sqrt{-\alpha s} + \frac{\gamma \epsilon^{1/2}}{2} \mp \frac{(4\beta - \gamma^2)\epsilon}{8\sqrt{-\alpha s}} + \dots$$
$$v \sim \mp \sqrt{-\alpha s} + \frac{\gamma \epsilon^{1/2}}{2} \pm \frac{(4\beta - \gamma^2)\epsilon}{8\sqrt{-\alpha s}} + \dots$$

Type B

$$u = v \sim \pm \sqrt{\frac{\alpha s}{3}} + \frac{\gamma \epsilon^{1/2}}{6} \mp \pm \frac{\sqrt{3}(12\beta + \gamma^2)\epsilon}{72\sqrt{\alpha s}} + \dots$$

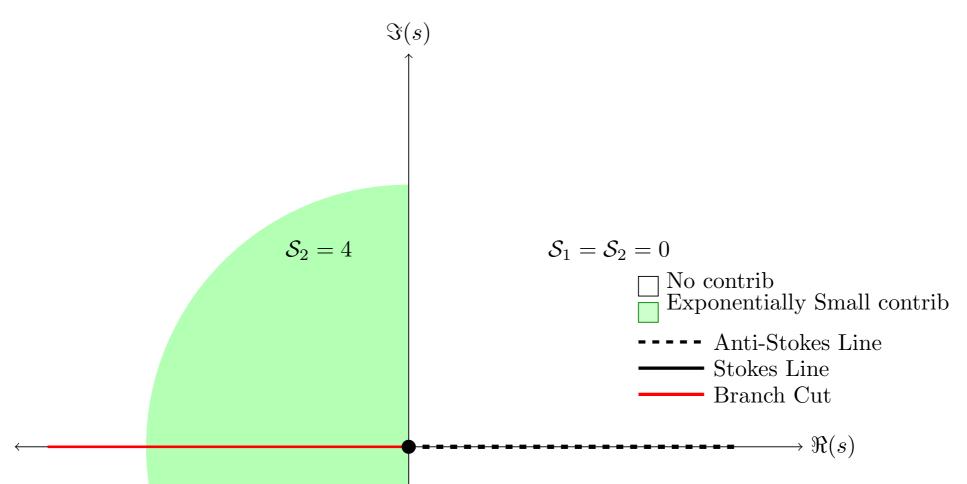

#### Late-order terms: Type A

$$u_{m} \sim \frac{\Lambda_{1} \Gamma(\frac{m-1}{2})}{(i\pi s/2)^{\frac{m-1}{2}}} + \frac{\Lambda_{2} \Gamma(\frac{m-1}{2})}{(-i\pi s/2)^{\frac{m-1}{2}}}$$
$$v_{m} \sim \frac{\Lambda_{3} \Gamma(\frac{m-1}{2})}{(i\pi s/2)^{\frac{m-1}{2}}} + \frac{\Lambda_{4} \Gamma(\frac{m-1}{2})}{(-i\pi s/2)^{\frac{m-1}{2}}}$$

Optimal truncation

$$u(s) \sim \sum_{m=0}^{N_o} \epsilon^{m/2} u_m(s) + S_1 \Lambda_1(-i)^{s/\epsilon} + S_2 \Lambda_2 i^{s/\epsilon}$$

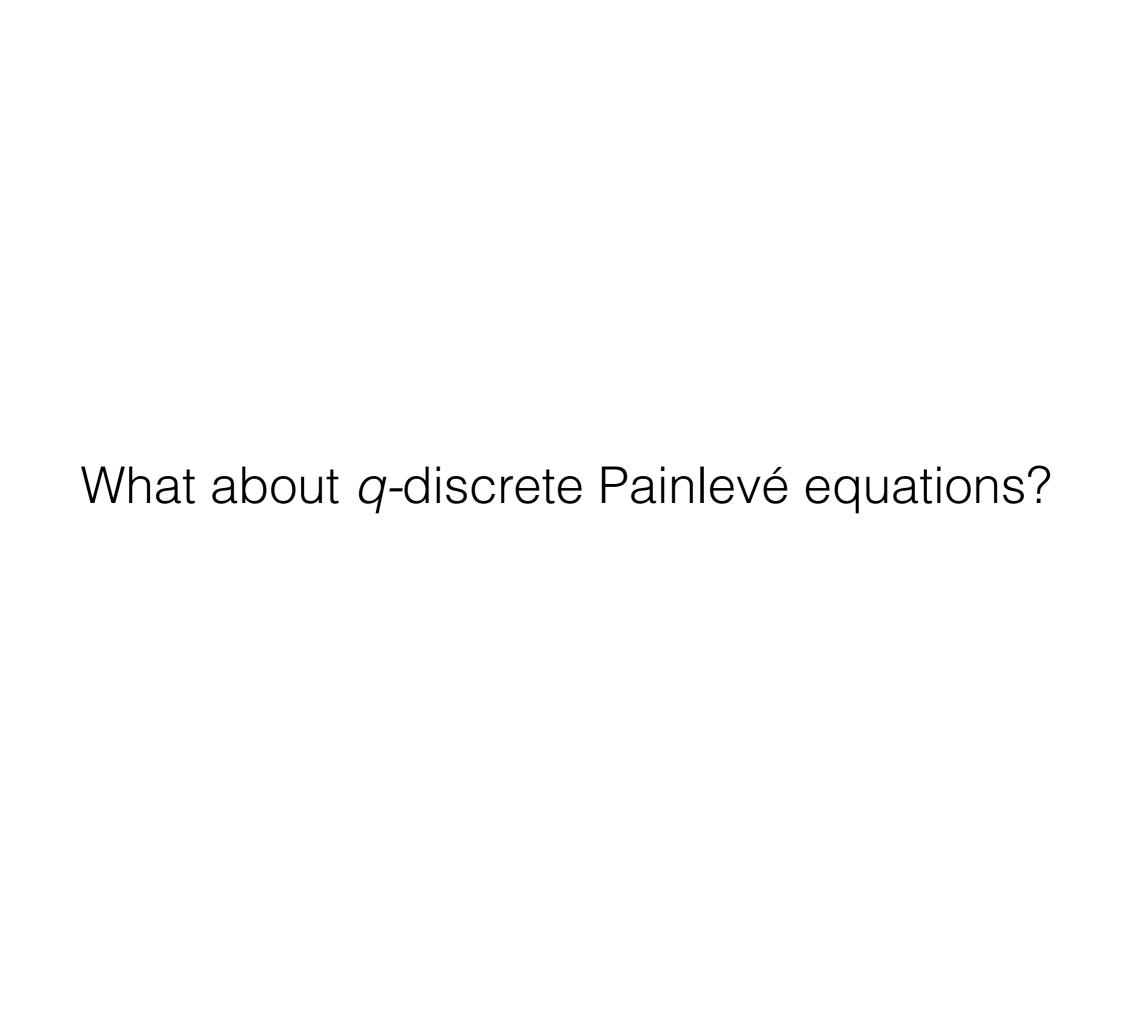

# Stokes Sectors: Type A

$$S_1 = 4$$

$$\mathcal{S}_1 = \mathcal{S}_2 = 0$$

Joshi & Lustri 2015

#### qP1

$$\Rightarrow \overline{w}\underline{w} = \frac{1}{w} - \frac{1}{\xi w^2} \quad (qP_I)$$

$$\overline{w} = w(q \xi), w = w(\xi), \underline{w} = w(\xi/q)$$

A limiting form of qP3, rescaled

$$\overline{g}\,\underline{g} = \frac{\alpha\,x}{g} + \frac{\beta}{g^2}$$
 Ramani & Grammaticos (1996) 
$$\overline{g} = g(\widetilde{q}\,x), \underline{g} = g(x/\widetilde{q})$$

 $\mapsto$  **PI**:  $y'' = 6y^2 - t$  in continuum limit.

# Behaviours near fixed points

$$\overline{w} \sim w, \quad \underline{w} \sim w, \quad |\xi| \to \infty$$

$$\Rightarrow w^4 = w + \mathcal{O}(1/\xi)$$

$$\Rightarrow w = \begin{cases} \omega + \mathcal{O}(1/\xi) & \omega^3 = 1 \\ \mathcal{O}(1/\xi) & \omega^3 = 1 \end{cases}$$

- qP<sub>I</sub> is invariant under rotation by argument  $2\pi/3$ , so  $\omega$  can be replaced by unity.
- The second case lies in neighbourhood of a merger of two base points:  $(1/\xi, 0)$ ,  $(q/\xi, 0)$ .

## Near unity

• Near  $w=1, \ \underline{w}=1, \ \exists$  a formal series solution

$$w = \sum_{n=0}^{\infty} a_n t^n, \quad a_0 = 1$$

where

$$a_{n}(q^{n} + 1 + q^{-n})$$

$$= -\sum_{l=1}^{n-1} a_{l} a_{n-l} (q^{(2l-n)} + 1)$$

$$-\sum_{m=1}^{n-1} \sum_{j=0}^{n-m} \sum_{l=0}^{m} a_{j} a_{n-m-j} a_{l} a_{m-l} q^{(n-m-2j)}$$

#### Near zero

• Near  $w=1/\xi, \ \underline{w}=q/\xi, \ \exists$  a formal series solution

$$w(\xi) = \sum_{n=1}^{\infty} \frac{b_n}{\xi^n}$$

where

$$b_1 = 1, \ b_2 = 0, \ b_3 = 0$$

$$b_n = \sum_{r=2}^{n-2} \sum_{k=1}^{r-1} \sum_{m=1}^{n-r-1} b_k b_{r-k} b_m b_{n-r-m} q^{(r-2k)}, \ n \ge 4$$

# Step 1: divergence

The coefficients of the asymptotic series grow very fast:

$$b_{3p+1} = \mathcal{O}\left(|q|^{3p(p-1)/2} \prod_{k=0}^{p-1} (1+q^{-3k})^2\right), |q| > 1$$

$$b_{3p+2} = 0, \ b_{3p+3} = 0, \ \forall p \ge 0$$

#### Step 2: Analytic Sum

 Use of the Borel-Ritt theorem provides an analytic function W s.t.

$$W(\xi) \sim \sum_{n=1}^{\infty} \frac{b_n}{\xi^n}$$

#### Step 3: Linearisation

The linearisation around W satisfies

$$\overline{P} + \left(2\frac{\overline{W}}{W} - \frac{1}{W^2 \underline{W}}\right) P + \frac{\overline{W}}{\underline{W}} \underline{P} = 0$$

which has solutions with behaviours

$$P^{\pm}(\xi) \sim q^{\pm 3 \, n(n \mp 5/3)/2}$$
  
 $\xi = \xi_0 \, q^n$ 

#### Step 4: True Solutions

The perturbed q-difference equation gives

$$v_n = \beta_0 P_n - P_n \sum_{j=n}^{n_0-1} \frac{W_j W_{j-1}}{P_j P_{j-1}} \sum_{k=k_0}^{j-1} \frac{P_k \mathcal{R}_2(v_k, v_{k-1}, t_k)}{W_{k+1} W_k}$$

where 
$$\|\mathcal{R}_2(v, \underline{v}, t)\| \le C_1 \|\mathbf{v}\|^2 + C_2 |t|$$
  
 $\|\nabla \mathcal{R}_2\| \le C_3 \|\mathbf{v}\| + C_4 |t|$ 

The contraction mapping theorem provides a true solution.

#### Quicksilver solution

- The vanishing solution approaches two base points.
- Its series expansion is divergent.
- We prove a true solution exists with this behaviour; it does not lie on a singularity of the underlying elliptic curve. So it is different to the *tritronquée* solutions of the Painlevé equations.
  - ⇒ new name: quicksilver solution
- It is unstable in initial-value space.

Joshi, Stud Appl Math (2014)

# Comparison

#### PI

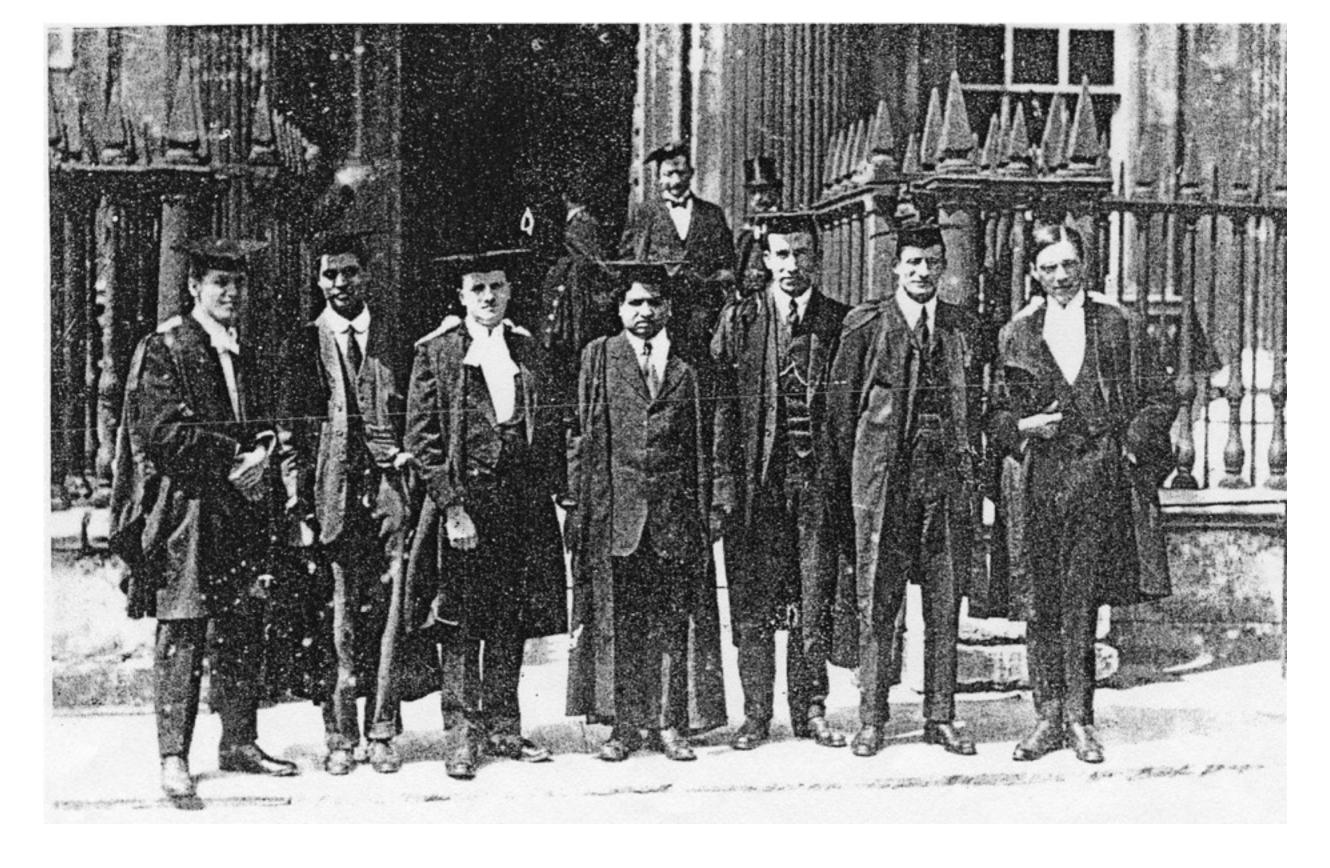

- No rational or classical solutions
- Leading-order behaviour is elliptic
- Two types of solutions described by asymptotic behaviours
- Tronquée solutions are asymptotic to a power series in a large sector

#### *qPI*

- No algebraic or solutions in terms of linear eqns Nishioka (2010)
- Leading-order behaviour is elliptic
- Four types of solutions described by asymptotic behaviours J (2014)
- Quasi-stationary solutions are asymptotic to a power series in a large region J (2014)

#### Summary

- New mathematical models of physics pose new questions for applied mathematics
- Global dynamics of solutions of non-linear equations, whether they are differential or discrete, can be found through geometry.
- Geometry provides the only analytic approach available in C for discrete equations.
- Tantalising questions about finite properties of solutions remain open.

The mathematician's pattern's, like those of the painter's or the poet's, must be beautiful, the ideas, like the colours or the words, must fit together in a harmonious way. *GH Hardy, A Mathematician's Apology, 1940*
